

Underground Double Wall Oilfield Drain and FKO Tanks

Underground Double Wall Oilfield Service Systems

ZCL double wall fibreglass tanks comply with Directive-055 "Storage Requirements for the Upstream Petroleum Industry" while greatly reducing the risk of expensive leak-related cleanups. Corrosion free internally and externally, ZCL tanks are guaranteed not to corrode. An interstitial design (annular space between inner and outer fibreglass walls) provides the security of continuous leak detection.

Tanks are safe for storage of most hazardous liquids including flare stack waste, produced water, and condensate. Reusable even after years of service, ZCL tanks will give you more than twice the service life of bare steel tanks. Discover for yourself why ZCL fibreglass tanks are the safest and longest lasting oilfield containment technology on the market.

The Corrosion Free Advantage

- Helps reduce benzene emissions
- Maintenance-free 100% fibreglass construction
- Eliminates the need for expensive piping supports
- No heating required (tank is buried below frost line) and robust, tanks can be buried to depths of 7ft.
- Corrosion resistant to produced water & most chemicals
- Reduces risk of hazardous rupture (safer for field personnel)
- Less expensive than comparable aboveground systems
- Minimizes risk of vandalism

Contact Us

With six manufacturing facilities in Canada & USA, ZCL | Xerxes has one of the largest tank manufacturing and distributing networks in North America.
